MnRI Showcase Day: Apps Script setup guide

MnRI Showcase Day: Apps Script setup guide

Goal: make the **vote** page and the **questions & suggestions** page save to a Google Sheet. About 5 minutes. Needs the Google account that owns (or can edit) the results sheet.

What it does

The website (GitHub Pages) cannot write to a Google Sheet by itself. A small Google Apps Script web app sits in between:

1. A visitor submits the vote form (`vote.html`) or the feedback form (`feedback.html`).
2. `forms.js` sends the answers to the web app URL stored in `config.js` (`SCRIPT_URL`).
3. `Code.gs` checks the answers and adds a row to the sheet.

Tab	Filled by	Columns
`Votes`	vote page	Timestamp, Poster, Title, Presenter, Voter name, Rating (1-5)
`Suggestions`	feedback page	Timestamp, Type, Name, Email, Message
`Results`	formula (created by `setup`)	Poster, Title, Presenter, Average rating, Votes (best first)

Target sheet: `1-ezuWR6rzrQ40mq7BLRDrpHvjJ3N15O5zQWPwoEar7Y` (set as `SPREADSHEET_ID` at the top of `Code.gs`). To use a different sheet, change that ID first.

Steps

1. **Create the project.** Go to https://script.google.com, click **New project**. Delete the sample code and paste in the whole of `apps-script/Code.gs` from this repo. Click **Save**.
2. **Run `setup` once.** In the function drop-down choose `setup`, click **Run**. Google asks for permission (Review permissions > pick your account > Advanced > Go to project > Allow). It creates the `Votes`, `Suggestions` and `Results` tabs in the sheet.
3. **Deploy as a web app.** Click **Deploy > New deployment**, gear icon > **Web app**. Set:
   - Execute as: **Me**

- Who has access: **Anyone**

Click **Deploy** and copy the **Web app URL** (it ends in `/exec`).

4. **Give the URL to the site.** In `config.js` set `SCRIPT_URL` to that URL, then commit and push:

```
window.MNRI_CONFIG = {
  SCRIPT_URL: "https://script.google.com/macros/s/XXXX/exec",
  SITE_URL: "https://thdhyan.github.io/mnri-showcase-day/"
};
```

Or send the URL to Claude and it will do this step.

5. **Test.** Open https://thdhyan.github.io/mnri-showcase-day/vote.html?poster=1-164-01, enter a name, pick a rating, submit. A new row should appear in the `Votes` tab within a few seconds. Delete the test row before the event. Do the same on `feedback.html`.

Notes

- The form posts in “no-cors” mode, so the page always shows “thanks” even if the script rejects the data. The sheet is the only proof. Always test once.
- Invalid votes (missing poster or name, rating outside 1-5) are dropped.
- A value starting with `=`, `+`, `-` or `@` is stored with a leading apostrophe so nobody can inject a spreadsheet formula.
- “Anyone” access only lets people send data to the script. It does not expose the sheet.
- One person can vote more than once. The sheet records names, so remove duplicates by hand if needed.
- After editing `Code.gs`: **Deploy > Manage deployments > pencil icon > Version: New version > Deploy**. The URL stays the same.

Troubleshooting

Symptom	Fix
Page says “This form is not connected yet”	`SCRIPT_URL` in `config.js` is empty; do step 4 and push.
No row appears	Deployment access is not **Anyone**, or an old version is deployed. Redeploy a new version.
`Exception: You do not have permission` in the editor	Re-run `setup` and approve the permissions.
`Results` tab is empty	No votes yet, or `Votes` tab was renamed.
